SPI INTERFACE

SIGNAL	PIN	DESCRIPTION
SPI_CLK	20	SPI clock. Supplied by the controlling computer (not the synthesizer). The controlling computer is the SPI master; the synthesizer is the SPI slave.
SPI_SS	18	SPI Slave Select. This signal is an active low input to the synthesizer. It frames command communications. For each command, SPI_SS goes low before the first bit is sent and goes high after the last bit is sent.
SPI_MISO	24	Master In/Slave Out. Status and other returned information from the synthesizer to the controlling computer.
SPI_MOSI	22	Master Out/Slave In. Command data from the controlling computer to the synthesizer.
TRIGGER	14	Rising edge active input. When enabled, the trigger signal of +3.3 V can initiate freq. change or step through lists or sweeps.
LOCK	16	Output indicates the synthesizer is locked on its current setting (+3.3 V locked, 0 V unlocked).
REF_LOCK	13	Output indicates the synthesizer has detected an external or internal reference signal and locked on that signal (+3.3 V locked, 0 V unlocked).
RESET	1	Internally pulled up to +3.3 V with 100 kΩ resistor. Active “low” signal, which has a minimum width of 1 ms, will reset the synthesizer to a default state.
PWR_+12V	26, 28, 30	External +12V DC supply.
GND	2, 15, 25, 27, 29	Ground.
N/C	3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 17, 19, 21 ,23	Do not use. Reserved for factory use.

Notes:

❶ Tested to 20.8 GHz.

❷ Full band step to ±5 ppm of final frequency.

❸ Measured between 2 and 20 GHz.

❹ Self calibration with USB command is available for in-field calibration.

❺ Adequate heat sinking must be provided in order to prevent permanent damage.

❻ Phase Matrix recommends Samtec manufactured mating socket assembly SFSD-15-28-G-XXX series.

⑦ "Typ." means approximately 2/3 of all units meet these characteristics at room temperature. Characteristics identified by typ. and nom. are by design and are not normally verified on every unit during production.

⑧ Communication specifications are available from the Phase Matrix website (www.phasematrix.com)
